I've developed a two new plugins for UMC. First being the WinCap plugin that allows you to open up more output windows so you can further organize stuff that comes to you. You can catch events and output it directly to a window, or output stuff there yourself using the display command. All windows referenced by an id number and you can set the window title, size and position from the command line if you want. The windows are floating so you can also resize it that way. Each window also has the ability to stay on top and to timestamp your output.

Commands:

- #window new - generates a new window
- #window settitle - changes the title of the given window
- #window setpos - sets the position on your desktop of where the window is at
- #window setsize - sets the window size of the given window.
- #window show - re-displays the the window in case you close it.
- #catch - sends the triggered event to the given window
- #display - sends the given text to the given window

The second plugin that i developed is called SysCall Plugin, or System Call, which is intended for the more advanced computer users, but allows them to call system commands from within the UMC client.

You can download the WinCap Plugin [her e](#) and the SysCall Plugin from [here](#) . Both are available from the downloads section of the website.

Example usage under windows:

- '#syscall ipconfig /renew' renews the ip address of all your adapters.
- '#syscall ipconfig /help' displays the help for ip config in umc.
